

Dear Friend,

If you're reading this, you've likely experienced something that most people never will: the moment you realize your funds are gone. Not stolen from a traditional bank where you have protections and insurance. Stolen on the blockchain—a permanent, immutable record that your loss is real and cannot be undone by simply calling customer service.

I know exactly what that feels like.

On June 16, 2026, I had 8,306 stXRP stolen from my wallet through a phishing scam. The attacker created a fraudulent contract that perfectly mimicked a legitimate governance platform. I clicked. I trusted. And then it was gone.

What followed was weeks of investigation—CSV downloads, spreadsheets, transaction analysis, manual pattern recognition across multiple exchanges. Work that most forensics firms charge thousands of dollars for. Work that should never require hiring a firm. It should be free. It should be accessible to anyone who's been victimized.

This tool was built because of that theft—and because of the sprawling laundering network I found while tracing those funds across the blockchain. I'm sharing it with you not as a product, but as a letter. A letter that says: you're not alone. What happened to you has happened to others. And now there's a free, open-source tool—built by someone who understands exactly what you're going through—that can help you see where your funds went.

This tool exists for three reasons. **First**, to help you understand—the consolidation wallets, the relay chains, the exchanges where funds eventually land. **Second**, to help law enforcement. I've filed complaints with the FBI and international authorities, and provided this tool as part of that documentation; when you file your own, you can use it to generate a professional forensics report they can act on. **Third**, to help you fight for recovery: tracing is the first step, filing formal complaints is the second, and taking those complaints to exchanges and regulators is the third. This tool gives you the ammunition for that fight.

I won't promise this tool will get your money back. Recovery is complex, spans multiple jurisdictions, and requires cooperation from exchanges that don't always prioritize victims. But I can promise you'll understand exactly what happened, with documentation you can hand to the people who can help.

I believe in the power of transparency, and in open-source tools that can't be monopolized. I believe victims of financial crime deserve the same forensics capabilities that only the wealthy could afford before.

This is my letter to you. This tool is my commitment to you.

If you recover even a portion of what was stolen, I hope you'll consider sharing your story—not for my benefit, but for the next victim who finds this tool and needs to know recovery is possible.

Stay strong. Stay persistent. And never stop fighting for justice.

With solidarity and hope,

Blockchain Forensics Researcher
July 2026

P.S. — If you file a complaint with law enforcement or an exchange, please reference this tool in your submission—it strengthens the case for everyone. If you discover new patterns or improvements, please contribute them back. We're all in this together.
